

Purchasing power of the euro and the French franc

Coefficient for the conversion of euros and francs in one year into euros and francs in another year

February 2011

The following table provides long time series (since 1910) for converting a past value expressed in French francs or in euro into prices for a given year (e.g. 2010).

The purchasing power of the euro and the French franc measures monetary erosion due to inflation.

HOW TO USE THE TABLE

The table is used to convert past French franc or euro values into current euros. It also can be used to convert 2008 euros values into past French francs or euros.

The following four examples show how these coefficients can be used.

1. You want to know how much the sum of 1,000 French francs in 1950 is worth in 2001 French francs to maintain the same purchasing power.

Go to the 1950 line.

Go to the 2001 column, where you will find 0.149.

Multiply the initial sum of FRF 1,000 by 0.149: the result is FRF 149.

In addition to inflation, the coefficient takes account of the transition from "old" French francs in circulation in 1950 to "new" French francs, used from 1960.

The purchasing power of FRF 1,000 in 1956 is hence equal to FRF 149 in 2001.

2. You want to find the purchasing power in 2010 euros of 1,000 French francs received in 2000.

Go to the 2000 line.

Go to the 2010 column, where you will find 0.18069.

Multiply the initial sum of FRF 1,000 French francs by 0.18069: the result is EUR 180.69.

In addition to inflation, the coefficient takes account of the transition from the French franc to the euro (EUR 1 = FRF 6.55957).

The purchasing power of FRF 1,000 in 2000 is hence equal to EUR 180.69 in 2010.

3. You want to calculate the purchasing power in 2000 French francs of 1,000 euros in 2010.

Go to the 2010 line.

Go to the 2000 column, where you will find the coefficient 5.534.

Multiply the initial sum of EUR 1,000 by 5.534: the result is FRF 5,534.

In addition to inflation, the coefficient takes account of the transition from the euro to the French franc (EUR 1 = FRF 6.55957).

The purchasing power of EUR 1,000 in 2010 is hence equal to FRF 5,534 in 2000.

4. You want to calculate the purchasing power in 2010 euros of 1,000 euros in 2009.

Go to the 2010 line.

Go to the 2009 column, where you will find the coefficient 0.985.

Multiply the initial sum of EUR 1,000 by 0.985: the result is EUR 985.

The purchasing power of EUR 1,000 in 2010 is hence equal to EUR 985 in 2009.

METHODOLOGICAL SUPPLEMENTS AND PRECAUTIONS

The deflator used by the experts for each year is the annual average of the published general price index, which covers the broadest population aggregate. We take the index for all urban households whose head is a manual or non-manual employee through to 1992 and the index for all households in mainland France as of 1993, when it was first published.

Starting in January 1999, the index used in the table covers all households in mainland France and the French overseas départements.

Users of these data should note that data robustness decreases as the time periods stretch into the past and that these data cannot be used as legally binding references.

The euro and French franc purchasing power indicator is suitable for measuring monetary erosion related to household consumption. However, it is not suitable for measuring the monetary erosion of assets made up of real estate and financial instruments not included in the general price index.

COEFFICIENT FOR THE CONVERSION OF EUROS AND FRANCS IN ONE YEAR INTO EUROS AND FRANCS IN ANOTHER YEAR

Deflator: general price index (Parisian serie through to 1962, index for "urban" households through to 1992, index for all households as of 1993)																						
1 FRF of the year	is equal in franc											is equal in euro									1 FRF of the year
