

Quality table for the Building Tendency Survey

CONTACT	
Country (Area)	France.
Survey	Business Survey in the Building Industry.
Service investigator	National Institute of Statistics and Economic Studies Economic Studies and National Accounts Directorate Short Term Economic Forecasts Department Business Tendency Surveys Division.
Reference year of data	2010.
Data of completion	March 2011.

METHODOLOGY	
Population Reference (Universe)	Legal units of the building industry. Around 26,000 firms.
Sampling frame	The base of the answers to the last available annual survey (ESA), which covers all the firms of the French territory, restricted to firms with more than 10 employees.
Size of the actual frame list	26,000 firms.
Characteristics of the frame list	Identification, address, contact, NACE code, number of employees, turnover.
Frame list update	Every year.
Sampling method	The sample is stratified by workforce and sector activity. The firms with more than 500 employees are automatically included into the sample. Updating every year or every two years: - sample cleaning: clearance of ceased or out of activity field firms; new big companies are included; - Sample increase: random drawing of firms according to a stratified sampling.
Sample size	2,500 units.
Sample coverage	47% in terms of turnover.
Sectors and/or categories currently covered	According to NAF rév. 2 classification: 41.2, 43.2, 43.3, 43.9.
Sample representativeness	Between 2 to 3 points of balance.
Response rate	Non-weighted response rate: 71,4% (annual average 2010). Weighted response rate (by turnover): 81% (annual average 2010).

METHODOLOGY (cont'd)	
Treatment of non-responses	"Constant sample" method: for qualitative questions, m-1 survey response is carried forward to m survey in case of non-response for this provisional operating. For m-1 survey definitive operating, an intermediate response between m and m-3 is attributed.
Weighting	Two-stage aggregation: - The first aggregation level leads to results at strata level. Within this first stage, individual responses to qualitative questions are weighted using the response of the surveyed to a yearly quantitative question concerning either turnover or the workforce, depending on the question; - At a second stage, strata average results are aggregated at less broken-up levels using weights computed from the Yearly Business Survey (EAE), using either turnover or the workforce, depending on the question.
Periodicity	Monthly.
Survey method	Postal mail or Internet data collection, since June 2007.
Fieldwork period	First 3 weeks of the current month.
Timeliness	4 working days before the end of the month.
Remarks	The first results relating to month m are provisional. Revised results are released at the end of the next month. These definitive results take into account of late responses arrived after the first release.
